

PRECONFIGURATION SERVICES

ENGINEERED SOLUTIONS

Impression Solutions, Inc. (ISI) can provide customized solutions based on customer's needs and environment. Engineered solutions can be as simple as determining the required device configuration for a given environment or desired output. Our solutions can become as complex as developing a device-level API that interacts with a customer's custom data string with an ultimate goal of replacing a proprietary printing device with our machines.

CONFIGURATION SERVICES

ISI maintains the only Kyocera Pre-configuration Center in the US. We can configure special requirements before ship out. Examples include:

- Loading preset device defaults
- IP configuration
- MAC Address Collection and Reporting
- Memory installation
- Specialized packing slips, and end-user instructions
- Including custom cable(s) in product box prior to shipment
- Asset labeling and tracking

We also provide customized software solutions such as form-overlays, application interfaces and emulation support.

SPECIAL MEDIA TESTING

Engineering can test special media types in our printers. The user would make the request through their sales rep or in some cases, directly to engineering. The user would need to send enough of the media and contact engineering with a description of how they will be using the printer.
